#### Key Formulae

- Derivatives of special functions:**  $\frac{d}{dx}(\sin x) = \cos x$ ,  $\frac{d}{dx}(\cos x) = -\sin x$ ,  $\frac{d}{dx}(e^x) = e^x$ ,  
 $\frac{d}{dx}(\ln x) = \frac{1}{x}$
- Chain rule:**  $\frac{d}{dx}[f(g(x))] = f'(g(x)) \cdot g'(x)$ ; e.g.  $\frac{d}{dx}(e^{kx}) = ke^{kx}$ ,  $\frac{d}{dx}(\ln(g(x))) = \frac{g'(x)}{g(x)}$
- Product rule:**  $\frac{d}{dx}[uv] = u'v + uv'$
- Quotient rule:**  $\frac{d}{dx}\left[\frac{u}{v}\right] = \frac{u'v - uv'}{v^2}$
- Second derivative:**  $f''(x) = \frac{d^2y}{dx^2}$ ; stationary point at  $f'(a) = 0$ : maximum if  $f''(a) < 0$ , minimum if  $f''(a) > 0$
- Point of inflection:**  $f''(a) = 0$  and  $f''$  changes sign at  $x = a$ ; concave up where  $f''(x) > 0$ , concave down where  $f''(x) < 0$
- Tangent at  $x = a$ :**  $y - f(a) = f'(a)(x - a)$ ; normal gradient =  $-\frac{1}{f'(a)}$

### GDC Tips

- **Evaluating a derivative numerically:** use Numeric Deriv / d/dx at a given  $x$ -value to find  $f'(a)$  or  $f''(a)$  when exact algebra is impractical.
- **Locating stationary points:** graph  $y = f'(x)$  and use Zero (or Root) to find  $x$ -values where  $f'(x) = 0$ ; confirm with d/dx on  $f$  itself.
- **Locating inflection points:** graph  $y = f''(x)$  and use Zero to find candidates; inspect the sign change of  $f''$  either side to confirm.
- **Classifying stationary points:** evaluate  $f''(a)$  using Numeric Deriv at the stationary  $x$ -value; negative  $\Rightarrow$  maximum, positive  $\Rightarrow$  minimum.
- **Sketching  $f'$  from  $f$ :** plot  $f$  and  $f'$  together to verify that zeros of  $f'$  align with turning points of  $f$ , and zeros of  $f''$  align with inflection points of  $f$ .
- **Tangent and normal lines:** use the Tangent feature (some models) or manually compute  $f'(a)$  numerically, then write the line equation — store  $f'(a)$  in a variable to avoid rounding errors.

### Common Mistakes to Avoid

1. **Wrong order in the quotient rule.** Students write  $uv' - vu'$  instead of  $u'v - uv'$  in the numerator. Always label  $u$  and  $v$  explicitly, differentiate each separately, then substitute into  $\frac{u'v - uv'}{v^2}$ .
2. **Forgetting the chain-rule factor.** When differentiating  $e^{g(x)}$  or  $\sin(g(x))$ , the outer derivative is written correctly but the inner derivative  $g'(x)$  is omitted. Every composite function requires multiplication by the derivative of the argument.
3. **Claiming an inflection point from  $f''(a) = 0$  alone.** Setting  $f''(x) = 0$  and finding a solution does not guarantee an inflection point; you must also show that  $f''$  changes sign at that  $x$ -value. If  $f''$  does not change sign, there is no inflection point.
4. **Misreading a graph of  $f'$  as a graph of  $f$ .** When the printed curve is labelled  $y = f'(x)$ , the zeros of the curve give the  $x$ -coordinates of stationary points of  $f$ , and the sign of the curve tells you where  $f$  is increasing or decreasing — not the other way around.
5. **Incorrect classification using  $f''$ : forgetting to state the evidence.** Writing “maximum” without quoting  $f''(a) < 0$  loses the reasoning mark R1. Every classification must name the test used and show the numerical or algebraic evidence.
6. **Missing solutions when solving  $f'(x) = 0$  on a closed interval.** Students find one stationary point algebraically but neglect to check the endpoints of the domain when determining the global maximum or minimum. Always evaluate  $f$  at every stationary point and at the endpoints.

Section A — Easy **EASY** (10 questions × 3 marks = 30 marks)

Scan me for help

1. **EASY** No Calculator [3 marks]

Let  $f(x) = e^{4x}$ , for  $x \in \mathbb{R}$ . Find  $f'(x)$ .

---

---

---

---

---

2. **EASY** No Calculator [3 marks]

Let  $g(x) = \ln(3x)$ , for  $x > 0$ . Find  $g'(x)$ .

---

---

---

---

---

3. **EASY** No Calculator [3 marks]

Let  $h(x) = x^3 e^{2x}$ , for  $x \in \mathbb{R}$ . Find  $h'(x)$ .

---

---

---

---

---

4. **EASY** No Calculator [3 marks]

Let  $f(x) = \frac{\sin x}{x^2 + 1}$ , for  $x \in \mathbb{R}$ . Find  $f'(x)$ .

---

---

---

---

---

5. **EASY** Calculator

[3 marks]

The graph of  $y = f(x)$  is shown below, where  $f(x) = -x^2 + 6x - 5$ , for  $0 \leq x \leq 6$ .

Find the  $x$ -coordinate of the stationary point of  $f$  and state its nature.

6. **EASY** Calculator

[3 marks]

Let  $f(x) = 3 \sin(2x)$ , for  $x \in \mathbb{R}$ . Find  $f''(x)$ .

7. **EASY** Calculator

[3 marks]

Let  $f(x) = (2x + 5)^4$ , for  $x \in \mathbb{R}$ . Find  $f'(x)$ .

8. **EASY** Calculator

[3 marks]

The derivative of a function  $f$  is given by  $f'(x) = 6x^2 - 6x$ , for  $x \in \mathbb{R}$ . Find the  $x$ -coordinates of the stationary points of  $f$ .

9. **EASY** Calculator

[3 marks]

The graph of  $y = f'(x)$  is shown below for  $-1 \leq x \leq 5$ .

Write down the  $x$ -coordinates of any stationary points of  $f$  on  $-1 \leq x \leq 5$ .

---

---

---

10. **EASY** Calculator

[3 marks]

Let  $f(x) = x^4 - 12x^2$ , for  $x \in \mathbb{R}$ . Find the  $x$ -coordinates of any points of inflection of  $f$ .

---

---

---

---

---

Section B — Medium **MEDIUM** (10 questions × 4 marks = 40 marks)

Scan me for help

11. **MEDIUM** No Calculator [4 marks]

Let  $f(x) = e^{3x} \sin x$ , where  $x \in \mathbb{R}$ .  
Find  $f'(x)$ .

---

---

---

---

---

---

12. **MEDIUM** No Calculator [4 marks]

Let  $g(x) = \frac{\ln x}{x^2}$ , where  $x > 0$ .  
Find  $g'(x)$  and hence find the exact  $x$ -coordinate of the stationary point of  $g$ .

---

---

---

---

---

---

13. **MEDIUM** No Calculator [4 marks]

Let  $h(x) = (2x^3 - 5)^4$ , where  $x \in \mathbb{R}$ .  
Find  $h'(x)$ .

---

---

---

---

---

---

14. **MEDIUM** Calculator

[4 marks]

The graph of  $y = f'(x)$  is shown below, where  $x \in [-1, 5]$ .

- Write down the  $x$ -values at which  $f$  has a stationary point. [1]
- Determine the nature of each stationary point. Justify your answers. [2]
- Write down the  $x$ -coordinate of the point of inflexion of  $f$ . [1]

---

---

---

---

---

---

---

---

15. **MEDIUM** No Calculator

[4 marks]

Let  $f(x) = x^2 e^{-x}$ , where  $x \in \mathbb{R}$ .

- Show that  $f'(x) = e^{-x}(2x - x^2)$ . [2]
- Find the  $x$ -coordinates of the stationary points of  $f$ . [2]

---

---

---

---

---

---

---

---

16. **MEDIUM** Calculator

[4 marks]

Let  $f(x) = \frac{3x+1}{x^2+4}$ , where  $x \in \mathbb{R}$ .

Find the  $x$ -coordinates of the stationary points of  $f$ , giving your answers to 3 significant figures.

---

---

---

---

---

---

17. **MEDIUM** No Calculator

[4 marks]

Let  $f(x) = \ln(x^2 + 3)$ , where  $x \in \mathbb{R}$ .

(a) Find  $f'(x)$ . [2]

(b) Find  $f''(x)$ . [2]

---

---

---

---

---

---

18. MEDIUM Calculator

[4 marks]

The curve  $C$  has equation  $y = x^3 - 6x^2 + 9x + 2$ , where  $x \in \mathbb{R}$ .

- (a) Find the  $x$ -coordinate of the point of inflexion of  $C$ . [2]
- (b) Determine whether the stationary point at  $x = 1$  is a local maximum or local minimum. Justify your answer. [2]

---

---

---

---

---

---

---

---

19. MEDIUM Calculator

[4 marks]

Let  $f(x) = \sqrt{4x^2 + 1}$ , where  $x \in \mathbb{R}$ .

- (a) Find  $f'(x)$ . [2]
- (b) The tangent to the graph of  $f$  at the point where  $x = 2$  has equation  $y = mx + c$ . Find the values of  $m$  and  $c$ . [2]

---

---

---

---

---

---

---

---

20. **MEDIUM** No Calculator

[4 marks]

Let  $f(x) = x \ln x - x$ , where  $x > 0$ .

(a) Show that  $f'(x) = \ln x$ . [2]

(b) Hence find the  $x$ -coordinate and  $y$ -coordinate of the stationary point of  $f$ , giving exact values. [2]

---

---

---

---

---

---

---

Section C — Hard **HARD** (10 questions  $\times$  5 marks = 50 marks)

Scan me for help

21. **HARD** No Calculator

[5 marks]

Let  $f(x) = x^2e^{-3x}$ , where  $x \in \mathbb{R}$ .

- (a) Show that  $f'(x) = xe^{-3x}(2 - 3x)$ . [2]
- (b) Find the  $x$ -coordinates of any stationary points of  $f$ , and determine the nature of each, justifying your answer using  $f''$ . [2]
- (c) Find the  $x$ -coordinate of the point of inflection of  $f$ , showing that a sign change in  $f''$  occurs. [1]

---

---

---

---

---

---

---

---

---

---

22. **HARD** No Calculator

[5 marks]

Let  $g(x) = \frac{\ln x}{x^2}$ , where  $x > 0$ .

- (a) Show that  $g'(x) = \frac{1 - 2 \ln x}{x^3}$ . [2]
- (b) Hence find the exact coordinates of the stationary point of  $g$  and justify that it is a maximum. [3]

---

---

---

---

---

---

---

---

---

---

23. **HARD** No Calculator

[5 marks]

A curve has equation  $y = \frac{e^{2x}}{3x-1}$ , where  $x \in \mathbb{R}$ ,  $x \neq \frac{1}{3}$ .

- Find  $\frac{dy}{dx}$ . [2]
- Find the exact  $x$ -coordinate of the stationary point. [2]
- Determine whether this stationary point is a local maximum or local minimum, justifying your answer. [1]

24. **HARD** Calculator

[5 marks]

The graph of  $y = f'(x)$  is shown below for  $x \in [-1, 5]$ .

- Write down the  $x$ -values at which  $f$  has a local maximum and a local minimum on  $(-1, 5)$ . [1]
- Find the  $x$ -coordinate of the point of inflection of  $f$ . [1]
- State the intervals on which  $f$  is concave down. [1]
- Given that  $f(1) = 4$  and the area enclosed between  $y = f'(x)$  and the  $x$ -axis from  $x = 1$  to  $x = 4$  is 4.5, find  $f(4)$ . [2]

25. **HARD** No Calculator

[5 marks]

Let  $h(x) = \sin(x^2 + 1)$ , where  $x \in \mathbb{R}$ .

(a) Show that  $h''(x) = 2 \cos(x^2 + 1) - 4x^2 \sin(x^2 + 1)$ . [3]

(b) Hence find the exact value of  $h''(0)$ . [1]

(c) Determine whether  $f$  is concave up or concave down at  $x = 0$ , justifying your answer. [1]

---

---

---

---

---

---

---

---

---

---

26. **HARD** Calculator

[5 marks]

The function  $f$  is defined by  $f(x) = x^3 - 6x^2 + 9x + k$ , where  $k \in \mathbb{R}$  and  $x \in \mathbb{R}$ .

It is given that  $f$  has a local minimum value of  $-2$ .

Find the value of  $k$ , the  $x$ -coordinate of the local maximum of  $f$ , and the  $x$ -coordinate of the point of inflection of  $f$ .

---

---

---

---

---

---

---

---

---

---

27. **HARD** **No Calculator**

[5 marks]

Let  $f(x) = \sqrt{4 - x^2}$ , where  $-2 < x < 2$ .

(a) Show that  $f'(x) = \frac{-x}{\sqrt{4 - x^2}}$ . [2]

(b) Show that  $f''(x) = \frac{-4}{(4 - x^2)^{3/2}}$ . [2]

(c) Hence justify that the graph of  $f$  has no point of inflection on  $-2 < x < 2$ . [1]

---

---

---

---

---

---

---

---

---

---

28. **HARD** **Calculator**

[5 marks]

The curve  $C$  has equation  $y = \frac{\sin x}{e^x}$ , where  $0 \leq x \leq 2\pi$ .

(a) Find  $\frac{dy}{dx}$ . [2]

(b) Find the  $x$ -coordinates of all stationary points of  $C$  on  $0 \leq x \leq 2\pi$ , giving your answers correct to 3 significant figures. [2]

(c) Determine the nature of each stationary point found in part (b), justifying your answer. [1]

---

---

---

---

---

---

---

---

---

---

29. **HARD** No Calculator

[5 marks]

A curve is defined by  $y = pxe^{-x/2}$  for  $x \in \mathbb{R}$ , where  $p > 0$ .

(a) Show that  $\frac{dy}{dx} = \frac{pe^{-x/2}(2-x)}{2}$ . [2]

(b) The tangent to the curve at the point where  $x = 4$  has gradient  $-e^{-2}$ . Find the value of  $p$ . [2]

(c) Using your value of  $p$ , find the  $x$ -coordinate of the point of inflection of the curve. [1]

30. **HARD** Calculator

[5 marks]

The function  $f$  is defined by  $f(x) = \frac{x^2 - 4x + 5}{x - 2}$ , where  $x \in \mathbb{R}$ ,  $x \neq 2$ .

Find the exact coordinates of any local maximum or local minimum points of  $f$ , justifying the nature of each. Then determine whether  $f$  has any points of inflection, justifying your answer.

## Mark Schemes

### Q1 — Differentiating an Exponential Function **EASY**

Using the chain rule (or standard result) with  $f(x) = e^{4x}$ :

$$f'(x) = 4e^{4x}$$

**M1A1**

Note: Award M1 for attempt to differentiate  $e^{kx}$  giving  $ke^{kx}$ . Award A1 for the correct coefficient 4 and A1 for the retained factor  $e^{4x}$ . Condone  $f' = 4e^{4x}$ .

### Q2 — Differentiating a Logarithm **EASY**

Applying the chain rule to  $g(x) = \ln(3x)$ :

$$g'(x) = \frac{1}{3x} \cdot 3$$

**M1**

$$g'(x) = \frac{1}{x}$$

**A1A1**

Note: Award M1 for an attempt using the chain rule. Award first A1 for  $\frac{3}{3x}$ . Award second A1 for the simplified answer  $\frac{1}{x}$ . Also accept via  $\ln(3x) = \ln 3 + \ln x$  leading directly to  $\frac{1}{x}$  for full marks.

### Q3 — Product Rule with an Exponential Factor **EASY**

Applying the product rule with  $u = x^3$  and  $v = e^{2x}$ :

$$h'(x) = 3x^2 \cdot e^{2x} + x^3 \cdot 2e^{2x}$$

**M1A1**

$$h'(x) = e^{2x}(3x^2 + 2x^3)$$

**A1**

Note: Award M1 for a correct product rule structure  $u'v + uv'$ . Award first A1 for both  $3x^2e^{2x}$  and  $2x^3e^{2x}$  correct (unsimplified). Award second A1 for the fully correct simplified form. Also accept  $x^2e^{2x}(3 + 2x)$ .

**Q4 — Quotient Rule with a Trigonometric Numerator** EASY

Applying the quotient rule with  $u = \sin x$ ,  $v = x^2 + 1$ :

$$f'(x) = \frac{\cos x \cdot (x^2 + 1) - \sin x \cdot 2x}{(x^2 + 1)^2}$$

**M1A1**

$$f'(x) = \frac{(x^2 + 1) \cos x - 2x \sin x}{(x^2 + 1)^2}$$

**A1**

*Note: Award M1 for a correct quotient rule structure  $\frac{u'v - uv'}{v^2}$ . Award first A1 for correct numerator terms. Award second A1 for the fully correct expression. Condone omission of simplification provided the numerator and denominator are correct.*

**Q5 — Stationary Point of a Quadratic** EASY

Finding  $f'(x)$ :

$$f'(x) = -2x + 6$$

**M1**

Setting  $f'(x) = 0$ :  $-2x + 6 = 0 \Rightarrow x = 3$

**A1**

Since  $f''(x) = -2 < 0$ , the stationary point at  $x = 3$  is a maximum.

**A1**

*Note: Award M1 for differentiating and setting equal to zero. Award first A1 for  $x = 3$ . Award second A1 for stating maximum with valid reason (e.g.  $f''(3) = -2 < 0$ , or a correct sign change of  $f'$ , or reference to the graph). Do not award the final A1 for nature without justification.*

**Q6 — Second Derivative of Sine** EASY

Differentiating  $f(x) = 3 \sin(2x)$ :

$$f'(x) = 6 \cos(2x)$$

**M1**

$$f''(x) = -12 \sin(2x)$$

**A1A1**

*Note: Award M1 for a correct attempt to differentiate twice using the chain rule. Award first A1 for  $f'(x) = 6 \cos(2x)$ . Award second A1 for  $f''(x) = -12 \sin(2x)$ . Condone notation  $\frac{d^2y}{dx^2}$ .*

**Q7 — Chain Rule with a Power Function** EASY

Applying the chain rule to  $f(x) = (2x + 5)^4$ :

$$f'(x) = 4(2x + 5)^3 \cdot 2$$

**M1A1**

$$f'(x) = 8(2x + 5)^3$$

**A1**

*Note: Award M1 for an attempt at the chain rule giving  $4(2x + 5)^3 \times (\text{derivative of inner function})$ . Award first A1 for the correct unsimplified form  $4(2x + 5)^3 \cdot 2$ . Award second A1 for  $8(2x + 5)^3$ .*

**Q8 — Finding Stationary Points from the Derivative** EASY

Setting  $f'(x) = 0$ :

$$6x^2 - 6x = 0$$

**M1**

$$6x(x - 1) = 0$$

$$x = 0 \quad \text{or} \quad x = 1$$

**A1A1**

*Note: Award M1 for setting  $f'(x) = 0$  and attempting to factorise or solve. Award first A1 for  $x = 0$ . Award second A1 for  $x = 1$ . Both values required for full marks.*

**Q9 — Reading Stationary Points from the Derivative Graph** EASY

Stationary points of  $f$  occur where  $f'(x) = 0$ , i.e. where the graph crosses the  $x$ -axis.

**R1**

From the graph:  $x = 1$

**A1**

and  $x = 4$

**A1**

*Note: Award R1 for the correct reason that stationary points occur where  $f'(x) = 0$ . Award first A1 for  $x = 1$ . Award second A1 for  $x = 4$ . Both values required for the two A1 marks. Do not accept  $y = 0$  without identifying the  $x$ -values.*

**Q10 — Points of Inflection** EASY

Finding  $f''(x)$ :

$$f'(x) = 4x^3 - 24x, \quad f''(x) = 12x^2 - 24$$

**M1**

Setting  $f''(x) = 0$ :  $12x^2 - 24 = 0 \Rightarrow x^2 = 2 \Rightarrow x = \pm\sqrt{2}$

**A1**

Checking sign change:  $f''(x) < 0$  for  $-\sqrt{2} < x < \sqrt{2}$  and  $f''(x) > 0$  outside this interval, confirming sign changes at both values. Points of inflection at  $x = -\sqrt{2}$  and  $x = \sqrt{2}$ .

**A1**

Note: Award M1 for correctly finding  $f''(x) = 12x^2 - 24$  and setting equal to zero. Award first A1 for both  $x = \pm\sqrt{2}$ . Award second A1 for confirming a sign change in  $f''$  at both values. Do not award the final A1 without evidence of a sign-change check.

**Q11 — Product Rule with an Exponential and Sine Function MEDIUM**

Recognising the product rule with  $u = e^{3x}$ ,  $v = \sin x$

**M1**

$u' = 3e^{3x}$ ,  $v' = \cos x$

**(A1)**

$$f'(x) = 3e^{3x} \sin x + e^{3x} \cos x$$

**A1**

Note: Accept the equivalent factored form  $e^{3x}(3 \sin x + \cos x)$ . Award M1 for a correct product rule structure with at least one derivative attempted correctly.

**Q12 — Quotient Rule with a Logarithmic Function MEDIUM**

Applying the quotient rule:

$$g'(x) = \frac{\frac{1}{x} \cdot x^2 - \ln x \cdot 2x}{x^4}$$

**M1**

$$g'(x) = \frac{x - 2x \ln x}{x^4} = \frac{1 - 2 \ln x}{x^3}$$

**A1**

Setting  $g'(x) = 0$ :  $1 - 2 \ln x = 0 \Rightarrow \ln x = \frac{1}{2}$

**M1**

$$x = e^{1/2} = \sqrt{e}$$

**A1**

Note: Award first M1 for correct quotient rule structure. Award final A1 for exact form only;  $x \approx 1.65$  alone is insufficient.

**Q13 — Chain Rule with a Composite Power Function** MEDIUM

Recognising the chain rule with inner function  $u = 2x^3 - 5$

**M1**

$$h'(x) = 4(2x^3 - 5)^3 \cdot \frac{d}{dx}(2x^3 - 5)$$

**(A1)**

$$\frac{d}{dx}(2x^3 - 5) = 6x^2$$

**(A1)**

$$h'(x) = 24x^2(2x^3 - 5)^3$$

**A1**

*Note: Award M1 for  $4(2x^3 - 5)^3$  multiplied by a derivative of the inner function. Do not penalise unsimplified forms provided the product is correct.*

**Q14 — Reading the Derivative Graph for Extrema and Inflexion** MEDIUM

**(a)**

$x = 1$  and  $x = 4$

**A1**

**(b)**

At  $x = 1$ :  $f'$  changes from positive to negative (the curve is above the axis before  $x = 1$  and below it just after), so this is a local maximum.

**R1**

At  $x = 4$ :  $f'$  changes from negative to positive, so this is a local minimum.

**R1**

Summary:  $x=1$ : local maximum;  $x=4$ : local minimum.

**A1**

*Note: Award R1 for explicit reference to the sign change of  $f'$  at each point. Award A1 for the correct nature of both stationary points. Answers without justification earn AOR0.*

**(c)**

$x = 2.5$

**A1**

*Note: The inflexion of  $f$  corresponds to the turning point (minimum) of  $f'$ , which occurs at  $x = 2.5$ . Accept  $x = \frac{5}{2}$ .*

**Q15 — Product Rule AG then Stationary Points** MEDIUM

**(a)**

$$\begin{aligned} f'(x) &= 2x \cdot e^{-x} + x^2 \cdot (-e^{-x}) \\ &= e^{-x}(2x - x^2) \end{aligned}$$

**M1**

**A1 AG**

*Note: Award M1 for correct application of the product rule with both terms present. The final line must be shown for AG; do not accept verification by expansion alone.*

**(b)**

$$\text{Setting } f'(x) = 0: e^{-x}(2x - x^2) = 0$$

**M1**

Since  $e^{-x} > 0$  for all  $x$ :  $x(2 - x) = 0$ , giving  $x = 0$  or  $x = 2$

**A1**

Note: Award A1 for both values. Award M1 for setting their  $f'(x) = 0$  and factoring correctly.

**Q16 — Quotient Rule Stationary Points via GDC MEDIUM**

Applying the quotient rule:  $f'(x) = \frac{3(x^2 + 4) - (3x + 1)(2x)}{(x^2 + 4)^2}$

**M1**

Numerator:  $3x^2 + 12 - 6x^2 - 2x = -3x^2 - 2x + 12$

**(A1)**

Setting  $-3x^2 - 2x + 12 = 0$ , i.e.  $3x^2 + 2x - 12 = 0$ , and solving using the GDC

**(M1)**

$x = -2.36$  or  $x = 1.69$  (3 s.f.)

**A1**

Note: Full precision:  $x = \frac{-2 \pm \sqrt{4 + 144}}{6} = \frac{-2 \pm \sqrt{148}}{6}$ , giving  $x = -2.360925 \dots$  and  $x = 1.694258 \dots$ ; rounded to 3 s.f. these are  $-2.36$  and  $1.69$ . Award (M1) for evidence of solving  $f'(x) = 0$  numerically. Award A1 for both values to 3 s.f.

**Q17 — Chain Rule then Second Derivative for a Logarithm MEDIUM**

**(a)**

$$f'(x) = \frac{1}{x^2 + 3} \cdot 2x$$

**M1**

$$f'(x) = \frac{2x}{x^2 + 3}$$

**A1**

**(b)**

Applying the quotient rule to  $f'(x)$ :  $f''(x) = \frac{2(x^2 + 3) - 2x \cdot 2x}{(x^2 + 3)^2}$

**M1**

$$f''(x) = \frac{2x^2 + 6 - 4x^2}{(x^2 + 3)^2} = \frac{6 - 2x^2}{(x^2 + 3)^2}$$

**A1**

Note: Award M1 for correct structure of the quotient (or product) rule applied to  $f'(x)$ . Accept equivalent unsimplified forms for A1.

**Q18 — Inflexion and Classification via Second Derivative MEDIUM**

**(a)**

$$f'(x) = 3x^2 - 12x + 9, f''(x) = 6x - 12$$

**M1**

$$\text{Setting } f''(x) = 0: 6x - 12 = 0 \Rightarrow x = 2$$

**A1**

Note: Candidates must find  $f''(x)$  correctly and set it to zero. A sign change of  $f''$  at  $x = 2$  (from negative to positive) confirms it is a point of inflexion, but this confirmation is not required for the marks here.

**(b)**

$$f''(1) = 6(1) - 12 = -6 < 0$$

**R1**

Since  $f''(1) < 0$ , the stationary point at  $x = 1$  is a local maximum. **A1**  
 Note: Award R1 for evaluating and stating the sign of  $f''(1)$  explicitly. Award A1 for the correct conclusion.  
 Answers without  $f''$  evaluation earn ROA0.

**Q19 — Chain Rule Tangent Line at a Point MEDIUM**

(a)  
 Writing  $f(x) = (4x^2 + 1)^{1/2}$  and applying the chain rule **M1**  

$$f'(x) = \frac{1}{2}(4x^2 + 1)^{-1/2} \cdot 8x = \frac{4x}{\sqrt{4x^2 + 1}}$$
 **A1**

(b)  
 At  $x = 2$ :  $f(2) = \sqrt{16 + 1} = \sqrt{17}$  and  $m = f'(2) = \frac{8}{\sqrt{17}}$  **(M1)**  
 Tangent:  $y - \sqrt{17} = \frac{8}{\sqrt{17}}(x - 2)$ , so  $c = \sqrt{17} - \frac{16}{\sqrt{17}} = \frac{17 - 16}{\sqrt{17}} = \frac{1}{\sqrt{17}}$  **A1**  
 $m = \frac{8}{\sqrt{17}} \approx 1.94, c = \frac{1}{\sqrt{17}} \approx 0.243$  (3 s.f.)  
 Note: Award (M1) for substituting  $x = 2$  into their  $f'(x)$  and  $f(x)$ . Award A1 for both correct values of  $m$  and  $c$ ; accept exact or 3 s.f. forms.

**Q20 — Product Rule AG then Exact Stationary Point MEDIUM**

(a)  

$$f'(x) = 1 \cdot \ln x + x \cdot \frac{1}{x} - 1$$
 **M1**  

$$= \ln x + 1 - 1 = \ln x$$
 **A1 AG**  
 Note: Award M1 for applying the product rule to  $x \ln x$  correctly. The  $-1$  must be differentiated to 0; both terms must appear before simplification for AG.

(b)  
 Setting  $f'(x) = 0$ :  $\ln x = 0 \Rightarrow x = 1$  **M1**  
 $f(1) = 1 \cdot \ln 1 - 1 = 0 - 1 = -1$ , so the stationary point is  $(1, -1)$  **A1**  
 Note: Award M1 for  $\ln x = 0$  leading to  $x = 1$ . Award A1 for both exact coordinates stated.

**Q21 — Product Rule Stationary Points and Inflection HARD**

(a)  

$$f'(x) = 2x \cdot e^{-3x} + x^2 \cdot (-3e^{-3x})$$
 **M1**  

$$= e^{-3x}(2x - 3x^2) = xe^{-3x}(2 - 3x)$$
 **AG**

(b)

Setting  $f'(x) = 0$ :  $x = 0$  or  $x = \frac{2}{3}$

A1

$$f''(x) = e^{-3x}(2 - 6x) + (2x - 3x^2)(-3e^{-3x}) = e^{-3x}(2 - 12x + 9x^2)$$

$f''(0) = 2 > 0$ , so  $x = 0$  is a local minimum;  $f''(\frac{2}{3}) = e^{-2}(2 - 8 + 4) = -2e^{-2} < 0$ , so  $x = \frac{2}{3}$  is a local maximum

A1

Note: Both natures must be stated with  $f''$  evidence for A1. Award A0 if only one point is addressed.

(c)

$$f''(x) = 0 \Rightarrow 9x^2 - 12x + 2 = 0 \Rightarrow x = \frac{12 \pm \sqrt{144 - 72}}{18} = \frac{12 \pm 6\sqrt{2}}{18} = \frac{6 \pm 3\sqrt{2}}{9} = \frac{2 \pm \sqrt{2}}{3}$$

i.e.  $x = \frac{6 - 3\sqrt{2}}{9}$  and  $x = \frac{6 + 3\sqrt{2}}{9}$ . The sign of  $f''$  changes at each root, confirming points of inflection.

A1

Note: Accept either inflection  $x$ -value with sign-change evidence. A sign table or evaluating  $f''$  either side is sufficient.

### Q22 — Quotient Rule and Exact Maximum Justification **HARD**

(a)

$$g'(x) = \frac{\frac{1}{x} \cdot x^2 - \ln x \cdot 2x}{x^4}$$

M1

$$= \frac{x - 2x \ln x}{x^4} = \frac{1 - 2 \ln x}{x^3}$$

AG

(b)

$$g'(x) = 0 \Rightarrow 1 - 2 \ln x = 0 \Rightarrow \ln x = \frac{1}{2} \Rightarrow x = e^{1/2} = \sqrt{e}$$

M1

$$g(\sqrt{e}) = \frac{\ln \sqrt{e}}{(\sqrt{e})^2} = \frac{1/2}{e} = \frac{1}{2e}; \text{ stationary point is } \left( \sqrt{e}, \frac{1}{2e} \right)$$

A1

For  $x$  slightly less than  $\sqrt{e}$ :  $\ln x < \frac{1}{2}$  so  $1 - 2 \ln x > 0$ , i.e.  $g' > 0$ ; for  $x$  slightly greater:  $g' < 0$ . The sign change  $+$   $\rightarrow$   $-$  confirms a local maximum.

R1

Note: Accept  $g''(\sqrt{e}) < 0$  as justification for R1. Condone  $e^{0.5}$  for  $\sqrt{e}$ .

### Q23 — Quotient Rule Stationary Point and Nature **HARD**

(a)

$$\frac{dy}{dx} = \frac{2e^{2x}(3x - 1) - e^{2x} \cdot 3}{(3x - 1)^2} = \frac{e^{2x}(6x - 5)}{(3x - 1)^2}$$

M1 A1

(b)

$$\frac{dy}{dx} = 0 \Rightarrow 6x - 5 = 0 \text{ (since } e^{2x} > 0 \text{ and } (3x - 1)^2 > 0 \text{ for } x \neq \frac{1}{3})$$

M1

$$x = \frac{5}{6}$$

A1

(c)

For  $x < \frac{5}{6}$ :  $6x - 5 < 0$  so  $\frac{dy}{dx} < 0$ ; for  $x > \frac{5}{6}$ :  $\frac{dy}{dx} > 0$ . The sign change  $- \rightarrow +$  confirms a local minimum.

**R1**

*Note: Award R1 only if the sign change is explicitly stated. Accept the second-derivative test if computed correctly.*

**Q24 — Reading the Derivative Graph Inflection and FTC Connection** **HARD**

(a)

$f'(x)$  changes from negative to positive at  $x = 1$ : local minimum at  $x = 1$ .

$f'(x)$  changes from positive to negative at  $x = 4$ : local maximum at  $x = 4$ .

**A1**

(b)

$f'$  has its maximum at  $x = 2.5$ , so  $f'' = 0$  (and changes sign) there; point of inflection of  $f$  at  $x = 2.5$ .

**A1**

(c)

$f'' < 0$  (i.e.  $f'$  is decreasing) for  $x \in (2.5, 5)$ ;  $f$  is concave down on  $(2.5, 5)$ .

**A1**

(d)

$$f(4) - f(1) = \int_1^4 f'(x) dx = 4.5$$

**M1**

$$f(4) = 4 + 4.5 = 8.5$$

**A1**

*Note: For M1 the Fundamental Theorem connection  $f(4) - f(1) = \int_1^4 f'(x) dx$  must be seen or clearly implied. Trap: do not accept  $f(4) = 4.5$  from forgetting to add  $f(1)$ .*

**Q25 — Chain Rule Twice Second Derivative and Concavity** **HARD**

(a)

$$h'(x) = \cos(x^2 + 1) \cdot 2x$$

**M1**

$$h''(x) = -\sin(x^2 + 1) \cdot 2x \cdot 2x + \cos(x^2 + 1) \cdot 2$$

**M1**

$$= 2\cos(x^2 + 1) - 4x^2 \sin(x^2 + 1)$$

**AG**

(b)

$$h''(0) = 2\cos(1) - 4(0)\sin(1) = 2\cos 1$$

**A1**

*Note: Accept  $2\cos(1)$ ; do not accept a decimal unless the exact form is shown first.*

(c)

$\cos 1 \approx 0.540 > 0$ , so  $h''(0) = 2\cos 1 > 0$ ;  $f$  is concave up at  $x = 0$ .

**R1**

*Note: R1 requires the sign conclusion and the words "concave up" (or equivalent). Award R0 if only the numerical value is stated without interpretation.*

**Q26 — Cubic with Local Minimum Value Giving the Constant k** **HARD**

$$f'(x) = 3x^2 - 12x + 9 = 3(x-1)(x-3) \quad \text{M1}$$

Stationary points at  $x = 1$  (local max) and  $x = 3$  (local min), since  $f''(x) = 6x - 12$ :  $f''(3) = 6 > 0$ . **A1**

Local minimum value:  $f(3) = 27 - 54 + 27 + k = k = -2$ , so  $k = -2$ . **A1**

Local maximum at  $x = 1$ ;  $f(1) = 1 - 6 + 9 - 2 = 2$ , so local maximum is  $(1, 2)$ . **A1**

$f''(x) = 0 \Rightarrow 6x - 12 = 0 \Rightarrow x = 2$ ;  $f''$  changes sign ( $-$  to  $+$ ) at  $x = 2$ , so point of inflection at  $x = 2$ . **A1**

*Note: Award the third A1 only if  $k = -2$  is found first. Trap: candidates may attempt to use  $x = 1$  for the minimum — reject by checking  $f''(1) = -6 < 0$ .*

**Q27 — Chain Rule Twice and No-Inflection Proof** **HARD**

(a)  
Write  $f(x) = (4 - x^2)^{1/2}$ ;  $f'(x) = \frac{1}{2}(4 - x^2)^{-1/2} \cdot (-2x)$  **M1**

$$= \frac{-x}{\sqrt{4 - x^2}} \quad \text{AG}$$

(b)  
Apply the quotient rule to  $\frac{-x}{(4 - x^2)^{1/2}}$ :

Numerator:  $(-1)(4 - x^2)^{1/2} - (-x) \cdot \frac{1}{2}(4 - x^2)^{-1/2}(-2x) = -(4 - x^2)^{1/2} - \frac{x^2}{(4 - x^2)^{1/2}}$  **M1**

$$= \frac{-(4 - x^2) - x^2}{(4 - x^2)^{1/2}} = \frac{-4}{(4 - x^2)^{1/2}}; \text{dividing by } (4 - x^2):$$

$$f''(x) = \frac{-4}{(4 - x^2)^{3/2}} \quad \text{AG}$$

(c)  
For all  $x \in (-2, 2)$ :  $(4 - x^2)^{3/2} > 0$ , so  $f''(x) = \frac{-4}{(4 - x^2)^{3/2}} < 0$  always;  $f''$  has no zero on  $(-2, 2)$ , hence no sign change occurs, so  $f$  has no point of inflection. **R1**

*Note: R1 requires the explicit statement that  $f''$  never equals zero AND therefore no sign change.*

**Q28 — Quotient Rule and GDC Stationary Points** **HARD**

(a)  
 $\frac{dy}{dx} = \frac{\cos x \cdot e^x - \sin x \cdot e^x}{e^{2x}} = \frac{\cos x - \sin x}{e^x}$  **M1 A1**

(b)  
Using the GDC to solve  $\cos x - \sin x = 0$  on  $[0, 2\pi]$ :  $\tan x = 1$ , giving  $x = \frac{\pi}{4}$  and  $x = \frac{5\pi}{4}$  **(M1)**

$x = 0.785$  and  $x = 3.93$  (3 s.f.) **A1**

Note: Both values required for A1. Accept exact  $\pi/4$  and  $5\pi/4$ .

(c)

At  $x = \pi/4$ : for  $x$  slightly less,  $\cos x > \sin x$  so  $dy/dx > 0$ ; for  $x$  slightly greater,  $dy/dx < 0$ : local maximum. At  $x = 5\pi/4$ : sign change  $- \rightarrow +$ : local minimum. **R1**

Note: Both natures required with sign-change evidence for R1.

**Q29 — Product Rule Tangent Gradient Gives the Constant p and Inflection** **HARD**

(a)

$$\frac{dy}{dx} = p e^{-x/2} + px \cdot \left(-\frac{1}{2}\right) e^{-x/2} = p e^{-x/2} \left(1 - \frac{x}{2}\right) \quad \text{M1}$$

$$= \frac{p e^{-x/2} (2 - x)}{2} \quad \text{AG}$$

(b)

$$\text{At } x = 4: \frac{dy}{dx} = \frac{p e^{-2} (2 - 4)}{2} = \frac{-2p e^{-2}}{2} = -p e^{-2} \quad \text{M1}$$

$$\text{Set equal to } -e^{-2}: -p e^{-2} = -e^{-2} \Rightarrow p = 1 \quad \text{A1}$$

(c)

$$\text{With } p = 1: \frac{d^2y}{dx^2} = \frac{d}{dx} \left[ \frac{e^{-x/2} (2 - x)}{2} \right] = \frac{1}{2} \left[ -\frac{1}{2} e^{-x/2} (2 - x) - e^{-x/2} \right] = \frac{1}{2} e^{-x/2} \left[ \frac{x - 2}{2} - 1 \right] = e^{-x/2} \left( \frac{x - 4}{4} \right) \quad \text{M1}$$

$$f''(x) = 0 \Rightarrow x = 4; \text{ sign changes from } - \text{ to } +, \text{ so point of inflection at } x = 4. \quad \text{A1}$$

Note: Trap — candidates may confuse the stationary point  $x = 2$  (where  $f' = 0$ ) with the inflection. Award A0 if  $x = 2$  is stated without support.

**Q30 — Rational Function Stationary Points and Inflection Decision** **HARD**

$$\text{Rewrite } f(x) = \frac{x^2 - 4x + 5}{x - 2}; \text{ apply the quotient rule:} \quad \text{M1}$$

$$f'(x) = \frac{(2x - 4)(x - 2) - (x^2 - 4x + 5)(1)}{(x - 2)^2} = \frac{2x^2 - 8x + 8 - x^2 + 4x - 5}{(x - 2)^2} = \frac{x^2 - 4x + 3}{(x - 2)^2} = \frac{(x - 1)(x - 3)}{(x - 2)^2} \quad \text{A1}$$

$$f'(x) = 0 \Rightarrow x = 1 \text{ or } x = 3 \quad \text{A1}$$

$$\text{At } x = 1: f(1) = \frac{1 - 4 + 5}{-1} = -2; \text{ sign of } f': \text{ for } x < 1, (x - 1) < 0, (x - 3) < 0, (x - 2)^2 > 0 \Rightarrow f' > 0; \text{ for } 1 < x < 2: (x - 1) > 0, (x - 3) < 0 \Rightarrow f' < 0: \text{ local maximum at } (1, -2). \quad \text{A1}$$

$$\text{At } x = 3: f(3) = \frac{9 - 12 + 5}{1} = 2; \text{ sign change } - \rightarrow +: \text{ local minimum at } (3, 2).$$

$f''(x) = \frac{2}{(x-2)^3}$  (from differentiating);  $(x-2)^3 \neq 0$  for  $x \neq 2$ , and  $f''(x) \neq 0$  for all  $x$  in the domain, so  $f''$  has no zero and no sign change; no point of inflection exists. **R1**

*Note: R1 requires the explicit statement that  $f''$  never equals zero on the domain and therefore no sign change. Trap: candidates may test  $x = 2$  (outside the domain) as a candidate inflection — this must be rejected since  $f$  is undefined there. Award R0 if the domain exclusion is not acknowledged.*
